Project Name	A Comprehensive Measure well being
Maximum Marks	2 Marks

Problem Statement

Human development varies significantly across countries due to differences in education, healthcare, and income. It is difficult to quickly analyze these factors and predict a country's Human Development Index (HDI). This project aims to develop a machine learning model that predicts HDI using key socio-economic indicators, helping policymakers and researchers make informed decisions to improve human development

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A Government Policy Maker	Analyze a country's Human Development Index (HDI)	It takes a lot of time to analyze multiple socio-economic indicators manually	The data is complex and spread across different sources	Frustrated and delayed in making decisions
PS-2	A Researcher / Data Analyst	Predict the HDI of a country accurately	Traditional methods are slow and less efficient	The relationship between education, health, and income is difficult to analyze manually	Challenged and less confident in the prediction
